big dye terminator reads only."
chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at http://www.asanger.ac.uk/HGP/ChL1
RP11-54A4 is from the library RPGT-11.1 constructed by the group of Pleter de Jong. For further details see http://www.ohori.org/bacpac/home.htm
WECTOR: pBACe3.6
HETO:/MPACH3.7
HIS sequence is not the entire insert of clone RP11-54A4 It may be shorter because we sequence overlapping sections only once. except for a short overlap.
The true left end of clone RP11-54A4 is at 1 in this sequence. Included the control of clone RP11-35A31 is at 174551 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           80613

on Feb 1, 2002 this sequence version replaced gi:18250748.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw., SMISSPROT; TT:, TARMBL; Wp., MORNPEP; Information on the WDMPEP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens

It currently consists of 37 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                     Center: Washington University Genome Sequencing Center

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                US-10-041-770-1

                                                      The present invention relates to seven members of the ADAMS (proteins which contain A Disintegrin And Metalloproteases domain) protein family. The ADAMS proteins and DNA may be used to treat disease, as a food additive or preservative, for chromosome identification, as probes for disquesing a disorder related to the female reproductive system, particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer.
                                                                                                                                                                                                                                                                         1480

```
genes, and AAE00900-AAE00915 represent the proteins they encode. AAD16777
-AAD16780 represent novel human genomic DNA fragments. The novel proteins
and their DNAs are useful for diagnosing, treating, preventing and/or
prognosing inflammatory disorders (bursitis or tendonitis); neural
disorders (e.g. Parkinson's disease, Alzheimer's disease); immune system
disorders; AIDS; autoimmune disease (e.g., rheumatoid arthritis);
muscular disorders; reproductive disorders; gastrointestinal disorders
(malabsorption syndrome, crohn's disease); pulmonary disorders;
cardiovascular disorders (myocardial infarction, ischaemia, arrhythmias);
renal disorders (glomerulonephritis, nephrotic syndrome); cancerous
(liseamia, hyperplasia); tumours; foetal and developmental
abnormalities; haematopoletic disorders; respiratory disorders (thinitis,
asthma); anglogenic disorders; diabetes; atherosclerosis; endocrine
clistoders; pregnancy-related disorders and infections. The novel protein
DNA is useful in gene therapy and anti-sense therapy. The proteins can
                                                                                                                                                                                                                                                                                                                                                                                                ö

AAD16750-AAD16775 represent cDNAs corresponding to novel human protein genes, and AAE09690-AAE09715 represent the proteins they encode. AAD16777 Genes, and AAE09690-AAE09715 represent the proteins they encode. AAD16777 and their DNAs are useful for diagnosing, treating, preventing and/or prognosing inflammatory disorders (bursitis or tendonitis); neural disorders; (bursitis or tendonitis); neural disorders; AIDS; autoimmune disease, Alzheimer's disease); immune system clostoring inflammatory disorders; peroductive disorders; gastrointestinal disorders (malabsorption syndrome, Crohm's disease); pulmonary disorders; cardiovascular disorders (malabsorption syndrome, Crohm's disease); pulmonary disorders; cardiovascular disorders (gomerulonephritis); nephrotic syndrome); candiovascular disorders (prophistis); nephrotic syndrome); candiovascular disorders (prophistis); nephrotic syndrome); candiovascular disorders; prophrotic syndrome); candiovascular disorders; prophrotic syndrome); candiovascular disorders; prophrotic disorders; atherosclerosis; endocrine conditions (breast cancer); hyperplasial; tumours; foetal and developmental candiovascular disorders; pregnancy related disorders; atherosclerosis; endocrine constitutions (disorders; pregnancy related disorders; atherosclerosis; endocrine constitution in gene therapy and anti-sense therapy. The proteins constitution also be used to aid wound healing and epithelial cell proliferation, construction constitution organs before

No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well sulted for isolating cDNA sequences con a sequence have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore bused to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                 Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;

The present invention describes primer sets for synthesising 5602

full-length cDNas defined in the specification. Where a primer set
comprises: (a) an oilgo-dT primer and an oilgounclectide complementary
to the complementary strand of a polynuclectide which comprises one of
the 5602 nuclectide comprises at least 15 nuclectides; or (b) a combination
of anouclectide comprising a sequence complementary to the
complementary strand of a polynuclectide which comprises a 5'-end
sequence and an oilgonuclectide comprising a sequence complementary to the
complementary strand of a polynuclectide which comprises a 5'-end
sequence and an oilgonuclectide comprising a sequence complementary to the
complementary strand of a polynuclectide which comprises a 5'-end
sequence and an oilgonuclectide comprising a sequence of the
oilgonuclectide which comprises a 3'-end sequence, where the
oilgonuclectide comprises a 3'-end sequence, where the
oilgonuclectide comprises a 1'-end sequence, where the
oilgonuclectide sequence and sequence and those complementary to a
polynuclectide which comprises a 1'-end sequence, where the
oilgonuclectide sequence and sequence and those defined in
the specification. The primers are useful for synthesising polynuclectides,
particularly full-length cDNAs. The primers are also useful for the
connection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH03632 to AAH03632
cepresent toligonuclectides, all of which are used in the exemplification
of the process of the primers and sequences; and AAH13632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Yamamoto J;

The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comptises: (a) an oilgo-dT primer and an oilgonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oilgonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oilgonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oilgonucleotide comprises a 3'-end sequence. The complementary to a polynucleotide which comprises a 3'-end sequence of polynucleotide which comprises a 3'-end sequence. The polynucleotide which comprises as a sequence of the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the CDNAs easily without any specialised methods. AAH0316 to AAH13628 and AAH13631 to AAH13612 to AAH13632 represent human animo acid sequences; and AAH13629 to AAH13632 represent human animo acid sequences; and AAH13632 to AAH13632 represent colling out the exemplification
                                                                                                                                                                                 Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.

                                                                                         ģ
                      В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Assoligy-Assolide, represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO. At the int/pub/published_pct_sequences.
                                                                                                                                                                                                      Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 693 BP; 159 A; 188 C; 204 G; 142 T; 0 other;

Claim 1; SEQ ID No 2762; 103pp; English.

The invention relates to isolated polynuclectide (I) and colymperse chain reaction (PCR) primers, oligomers, and for chromosome polymperse chain reaction (PCR) primers, oligomers, and for chromosome conjumerse chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The choint deceives a expressed sequence tags of for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or second supplement. (II) and its binding partners are useful in medical information of sites expressing (II). (II) and its binding partners are useful in medical information as polypeptide in tissue, as molecular weight markers and constructivity aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in chagnostics foremists, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and chagnostics foremists, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Camino acid sequences Associates of the invention of came directly from WIPO Configuration, but was obtained in electronic format directly from WIPO Configuration, but was obtained in electronic format directly from WIPO Configuration, but was obtained in electronic format directly from WIPO Configuration and Config

The invention relates to genes derived from murine adipocytes and proteins encoded by these genes. The proteins are associated with adipocyte differentiation and can be expressed by standard recombinant methodology. The genes, proteins and specific antibodies are useful for the identification of drugs for treatment and prevention of adipocyterielated disorders such as obesity, hyperlipemia, diaberes and atherosclerosis. The present sequence represents a DNA encoding a protein derived from murine adipocytes. Adipocyte; murine; differentiation; obesity; hyperlipemia; diabetes; Genes associated with adipocyte differentiation for screening adipocyte-related disorders such as diabetes and hyperlipemia Sequence 1927 BP; 509 A; 536 C; 517 G; 365 T; 0 other; Murine adipocytes-derived protein encoding DNA. Claim 2; Fig 24A-D; 209pp; English.

The invention provides human and mouse nucleic acids designated TANGO CG 204, TANGO 206, TANGO 209 and A236 encoding secreted or transmembrane proteins. The polypeptides, nucleic acids and their modulators may be useful for treating or modulating cholesterol uptake, blood coagulation, to modulate cell proliferation, morphogenesis and fate specification, tissue repair and renewal, to treat cancer and promote wound healing, computed angiogenesis, treat hypercholesterolemia, hemophilia, Marfan syndrome, protein 8 deficiency, modulate allergic or inflammatory response, acid secretion, tropic effects on gastrointestinal mucosa, and promote ulcer healing, treat bone cancer, achandroplasia, myeloma, commonte ulcer healing, treat bone cancer, achandroplasia, brain fibrous dysplasia, scoliosis, ostecanthitis, osteosarcoma, osteoporosis, leukemia, anemia, thalassemia, cerebral edema, hydrocephalus, brain chemitations, meningitis, ischemic brain or heart disease, infarction, intracranial hemorage, pancreatifis, diabetes, angina, hypotenaive heart disease, moningitis, ischemic brain or heart disease, infarction, chemitas, hypotarelaid insease, atherosclerosis, hypertension, jaundice, hepatic failure, cirrhosis, glomerulomephritis, Goodpasture's syndrome, conspirate and proparate disease, constitute, cirrhosis, glomerulomephritis, Goodpasture's syndrome, neoplasia, pulmonary disorders asthma, ovarian disorders, McCune conspirate sequence represents the mouse A236 oDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides human and mouse nucleic acids designated TANGO 206, TANGO 209 and A236 encoding secreted or transmembrane proteins. The polypeptides, nucleic acids and their modulators may be useful for treating or modulating cholesterol uptake, blood coagulation, to modulate angiogenesis, and fate specification, tissue repair and renewal, to treat cancer and promote wound healing, modulate angiogenesis, treat hypercholesterolemia, hemophilia, Marfan syndrome, protein S deficiency, modulate allergic or inflammatory response, acid secretion, tropic effects on gastrointestinal mucosa, and promote ulcer healing, treat bone cancer, achandroplasia, myeloma, fibrous dysplasia, caliosis, osteoarthritis, osteosarcoma, osteoporosis, leukemia, anemia, thalassemia, cerebral edema, hydrocephalus, brain herniations, meningitis, isohemic brain or heart disease, infarction, intracranial hemorage, pancreatitis, diabetes, angina, hypotensive heart
                                                                                                                                                                                                                                                                                                     TANGO 204; TANGO 206; TANGO 209; A236; secreted protein; human; mouse; transmembrane protein; antianemic; cerebroprotective; arteriosclerosis; antiasthmatic; neuroprotective, cytostatic; cardian; hepatotropic; antiinflammatory; antiabetic; antiinfertility; antipyratic; vasotropic; antiinheumatic; nephrotropic; hemostatic; antiilpemic; osteopathic; ophthalmological; antisickling; antiulcer; vulnerary; variant; ss.

proteins. The polypeptides, nucleic acids and their modulators may be useful for treating or modulating cholesterol uptake, blood coagulation, condulate cell proliferation, morphogenesis and fate specification, tissue repair and renewal, to treat cancer and promote wound healing, modulate analyogenesis, treat hypercholesterolemia, hemophilia, Marfan syndrome, protein S deficiency, modulate allergic or inflammatory response, acid secretion, tropic effects on gastrointestinal mucosa, and promote ulcer healing, treat bone cancer, achandroplasia, myeloma, fibrous dysplasia, scoliosis, osteosarcoma, osteoporosis, cluvemia, anemia, thalassemia, cerebral edema, hydrocephalus, brain herniations, menigitis, ischemic brain or heart disease, infarction, intracranial hemorage, pancreatitis, diabetes, angina, hypotensive heart disease, myocardial disease, rheurase, acherosciacosis, hypertension, jaundice, hepatic failure, cirrhosis, glomerulonephritis, Goodpasture's syndrome, clasease, mernias, hypoadrenalism, hyperatension, jaundice, neoplasia, pulmonary disorders, asthma, ovarian disoase. The present sequence represents a mouse A236 variant cDNA.

Conformation provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for screening compounds, which interfere with the inhibition of the function of RecQ helicases by

```

```
cc hepatitis C virus (HCV) proteins. The method can be used to identify compounds which can be used for the prevention and treatment of liver compounds which can be used for the prevention and treatment of liver cd disorders associated with HCV infection, such as liver cancer. The CC present sequence was used in the present invention.

                                                                  The present invention relates to seven members of the ADAMS (proteins which contain A Disintegrin And Metalloprotease domain) protein family. The ADAMS proteins and DNA may be used to treat disease, as a food additive or preservative, for chromosome identification, as probes for disapposing a disorder related to the female reproductive system, particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                          ERCGHLPRPNITQSCQLRLCGHWEVGSPWSQCSVRCGRGQRSRQVRCVGNNGDEVSEQEC 823

AAD16750-AAD16775 represent CDNAs corresponding to novel human protein genes, and AAE09690-AAE09715 represent the proteins they encode. AAD16777 genes, and AAE09690-AAE09715 represent the proteins they encode. AAD16777 and they are useful for diagnosing, treating, preventing and/or prognosing inflammatory disorders (bursitis or tendonitis); neural or prognosing inflammatory disorders (bursitis or tendonitis); neural consorders (e.g. Parkinson's disease, Albahamer's disease); immune system disorders; AIDS; autoimmune diseases (e.g. rhemmatoid arthritis); muscular disorders; reproductive disorders; gastrointestinal disorders (malabsorption syndrome, Crohm's disease); pulmonary disorders; cardiovascular disorders (myocardial infarction, ischaemia, arrhythmias); candiovascular disorders (myocardial infarction, ischaemia, arrhythmias); candiovascular disorders (myocardial infarction, ischaemia, arrhythmias); candisoans (breast cancer); hyperproliferative disorders (leukaemia, hyperplasia); tumours; foetal and developmental abordering abnormalities; haematopoletic disorders; atheorosic costs; endocrine disorders; pregnancy-related disorders; and infections. The novel protein Codisorders; pregnancy-related disorders and infections. The novel protein also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before cragenerate tissues, to identify their cognate ligands or binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytostatic; gene therapy; inflammatory disorder; neural disorder; Parkinson's disease; Alzheimer's disease; immune system disorder; ALDS; autoimmune disease; rheumatoid arthritis; muscular disorder; ischaemia; reproductive disorder; Crohn's disease; pulmonary disorder; cancer; myocardial infarction; glomeurulonephritis; nephrotic syndrome; tumour; haematopoletic disorder; rhinitis; asthma; diabetes; atherosclerosis; anti-sense therapy; endocrine disorder; leukaemia.

cc -AAD16780 represent novel human genomic DNA fragments. The novel proteins and their DNAs are useful for diagnosing, treating, preventing and/or discorders (e.g. parkinson's diseases, Alzheimer's diseases); immune system disorders; (e.g. parkinson's diseases, Alzheimer's diseases); immune system calsorders; AIDS; autoimmune diseases (e.g., rheumatoid arthritis); muscular disorders; creproductive disorders; gastrointestinal disorders; cardiovascular disorders (myocardial infarction, ischaemia, arrhythmias); cardiovascular disorders (glomerulonephritis, nephrotic syndrome; cancerous disease and conditions (breast cancer); hyperproliferative disorders (leukaemia, hyperplasia); tumours; foetal and developmental abnormalities; haematopodetic disorders; respiratory disorders (thinitis, abnormalities; haematopodetic disorders and infections. The novel protein synhma); angiogenic disorders; disorders and infections. The novel protein calsorders; pregnancy related disorders and infections. The proteins calso be used to aid wound healing and epithelial cell proliferation, cor supporting cell culture of pringers before cagnerate tissues, to identify their cognate ligands or binding cagnerate tissues, to identify their cognate ligands or binding carpersents a novel human protein of the present sequence cor preservative to modify storage properties. The present sequence cor preservative to modify storage properties. The present sequence for this patent did not form part of the corrective printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GARPPASPEPCHGIPCPPYWEAGEWISCSRSCGPGIQHRQLQCRQEFGGGGSSVPPERCG 767

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel metalloprotease containing a thrombospondin domain (MPTS protein) is useful to treat aggreean associated disease including rheumatoid arthritis and osteoarthritis -
                                                                                                        The present invention relates to seven members of the ADAMS (proteins which contain A Disintegrin And Metalloprotease domain) protein family. The ADAMS proteins and DNA may be used to treat disease, as a food additive or preservative, for chromosome identification, as probes for diagnosing a disorder related to the female reproductive system, particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                         435 EKVQDGTLCQPGAPDICVAGRCLSPGCDGILGSGRRPDGCGVCGGDDSTCRLVSGNLTDR 494

This invention describes a novel metalloprotease containing a thrombospondin domain (MPTS protein) which is useful to treat aggreean associated disease including rheumatoid arthritis and osteoarthritis. The products of the invention have osteopathic, antiarthritic, antiarthritic, antipsoriatic and antirheumatic activity. MPTS may be used to identify modulator of its activity, e.g., an agoinst or antagonists. Such compounds, as well as MPTS itself may be used to treat disease associated with MPTS activity or aggreean degradation, particularly osteoarthritis, rheumatoid arthritis, psoriasis, spondyllitis, sport injury, joint trauma or fibrosis. This sequence represents the human MPTS-19 metalloprotease described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                VWRPIFICISRESGEELDERSCAAGARPPASPEPCHGTPCPPYWEAGEWTSCSRSCGP-G 742

                                                                                                                                                                                                                                                                                                               The present sequence represents a disintegrin and metalloprotease (ADAM) type metal protease designated MDTS1, isolated from human. MDTS proteins have cytostatic and antiarthritic activities. They can be used as a drug for cancers, arthritis and arthrosis deformans.

useful for diagnosing, treating or preventing cancer, rheumatoid arthritis, ocular neovascularisation, wound healing, immune associated discass end gestational diseases (e.g. pre-clampsia). TSRX and TSRX and greated can be used to identify members of the TSR superfamily, to screen for molecules which inhibit or enhance TSRX activity or to screen for molecules which inhibit or enhance TSRX activity or function, as targets for identification of small molecules that modulate cor inhibit e.g. anglogenesis or neuronal development. Also TSRX antisense molecules or other agonists are useful for detecting and treating breast cancer. TSRX activity or expression as well as to treat disorders characterised by insufficient or excessive production of TSRX forms that have decreased or aberrant activity production of TSRX forms that have decreased or aberrant activity compared to TSRX wild-type. Anti-TSRX antiboddes can be used to isolate TSRXs and modulate TSRX activity. Portions or fragments of TSRX cDNAs activity. Portions or fragments of TSRX cDNAs activity. Portions or fragments of TSRX cDNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            24;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                įs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention in useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of discloses genomic DNA sequences (ABLIG175) and pharmaceutical drugs. The invention sequences (ABLIG175) and the encoded proteins (ABB37737-ABB72072).

The sequence acts for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed appecification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                 3060 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO200111074-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                            and metalloprotease domain with thrombospondin type I motifs) proteins, designated ADAWTS-5, 6, 7, 8, 9, 10 and R1. Also included in the invention are cDNA sequences encoding the proteins, and antibodies specific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate ADAWTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tunnour cachexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos syndrome type VIIC (EDS-VIIC) in humans, erosion of articular cartilage in artiritic (both inflammatory and non-inflammatory) disease, angiogenesis, tumour growth and metastases, and they may also be used for controlling embryogenesis and implantation of fertilised eggs. The present sequence represents human ADAMTS-10.

This invention relates to murine and human ADAWTS-N (A disintegrin-like designated ADAWTS-5, 6, 7, 8, 9, 10 and RT. Also included in the invention are CDNA sequences encoding the proteins, and antibodies specific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate ADAMTS-N expression. Disorders that may be treated with inappropriate ADAMTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tumour acchexia, inflammation, dermatosparaxis in cattle or Ehlers-Danlos syndrome type VIIC (EDS-VIIC) in humans, erosion of articular cartilage in arthritic (both inflammatory and non-inflammatory) disease, controlling embryogenesis and implantation of fertilised eggs. The present sequence represents human ADAMTS-10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADAWTS-N; disintegrin; metalloprotease; thrombospondin type I motif; tumour cachexia; inflammation;, dermatosparaxis; EDS-VIIC; anglogenesis; Ehlers-Danlos syndrome type VIIC; articular cartilage erosion; human; metastasis; embryogenesis; egg implantation; ADAWTS-10.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to seven members of the ADAMS (proteins which contain A Disintegrin And Metalloprotease domain) protein family. The ADAMS protein family may be used to treat disease, as a food additive or preservative, for chromosome identification, as probes for disquesting a discrete related to the female reproductive system, particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Seven nucleic acid molecules encoding ADAM polypeptides containing a disintegrin and metalloprotease domain, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases

Ruben SM; (HUMA-) HUMAN GENOME SCI INC Rosen CA, Barash SC,

WPI; 2001-451925/48. P-PSDB; AAE09713.

Isolated polypeptide for treating, preventing and/ or prognosing medical disorders and also for testing and detection e.g. diagnosis screening for agonists -

Claim 1; SEQ ID No 34; 469pp; English.

AAD16750-AAD16775 represent cDNAs corresponding to novel human protein genes, and AAE09690-AAE09715 represent the proteins they encode. AAD16777-AAD16780 represent novel human genomic DNA fragaments. The novel proteins and their DNAs are useful for diagnosing, treating, preventing and/or prognosing inflammatory disorders (bursitis or tendonitis); neural disorders (e.g. Parkinson's disease, Alzheimer's disease); immune system disorders; autoimmune diseases (e.g., rheumatoid arthritis); muscular disorders; reproductive disorders; gastrointestinal disorders (malabsorption syndrome, Crohn's disease); pulmonary disorders;

```
cardiovascular disorders (myocardial infarction, ischaemia, arrhythmias); renal disorders (glomerulonephritis, nephrotic syndrome); cancerous disease and conditions (breat cancer); hyperproliferative disorders (leukaemia, hyperplasia); tumours; foetal and developmental abnormalities; haematopoietic disorders; respiratory disorders (rhinitis, asthma); andjogenic disorders; diabetes; atherosclerosis; endocrine disorders; pregnancy-related disorders and infections. The novel protein DNA is useful in gene therapy and anti-sense therapy. The proteins can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human novel protein-encoding gene 9 cDNA clone HUCMO06, SEQ ID NO:19.

```

The present sequence is a CDNA encoding 27875 protein, a human ADAM-TS (a disintegrin and metalloproteinase). Metalloproteinase is a protein maturation, protein degradation, throughout to protein maturation, protein degradation, cumour growth, metastasis and angiogenesis. Nucleotides encoding 27875, 27875 metalloproteinase-related disorders. These disorders and treating 27875 metalloproteinase-related disorders. These disorders include, disorders involving the lung such as congenital anomalias, conscients involving the lung such as congenital anomalias, conscients involving the skeletal muscle include tumours such as the construction, disorders involving the skeletal muscle include tumours such as the crabicomy caarcoma, disorders involving the skeletal muscle include tumours such as congenitation, atherosclerosis, vasculitis associated with other disorders, disorders involving the testis and epididymis such as nonspecific epididymitis and orchitis, genomeratocytic caminoma, disorders involving the kidney such as membranoproliferative glomerulonephritis, necrotising glomerulonephritis, renal artery contentials, chancing construction, disorders of the bone such as achondroplasia, curinary tract obstruction, disorders of the bone such as achondroplasia, curinary tract obstruction, disorders of the bone such as achondroplasia, curinary tract obstruction, disorders of the bone such as achondroplasia, curinary tract obstruction, disorders of the bone such as achondroplasia, curinary tract obstruction, disorders of the bone such as achondroplasia, thymomas, and Hodgkin's disease. 27875 sequence is used in gene therapy. Note: This sequence shown in Page 115.123 (See AAD04475), However these sequences continues and differ at several locations. Novel isolated polypeptide, 27875, a human ADAM-TS (a disintegrin and metalloproteinase) useful for diagnosis and treatment of disorders of bone, lung, heart, skeletal muscle such as osteoporosis, emphysema, 731 TCTACACCAGCGGTCGGTCAGCAAAGAGAGTGGGTGGAGACCCTGGTAG 780 781 TAGCTGATGCCAAAATGGTGGAGTACCACGGACAGCCGCAGGTTGAGAGC 830 ......GlyHisSerLeuGlnT 35 20 15 LeuLeuSerLeuProGlnLeuCys......LeuAs 24 Sequence 5353 BP; 960 A; 1833 C; 1649 G; 911 T; 0 other; hrProThrGluGluGlyGlnGlyProGluGlyValTrpGlyProTrp... 331 TATGTGCTGACCATCATGAACATGGTGGCTGGCCTGTTTCATGACCCCAG Length: 959 Gaps: 41 Percent Identity: 28.050 to: 5353 from: 1 ä Claim 7; Fig 1; 133pp; English. 24 pGlnGluValLeuSer..... 808.50 1.817 46.403 Align seg 1/1 to: AAD04494 alignment\_block: US-10-041-770-2 x AAD04494 Kapeller-Libermann R, WPI; 2001-300513/31 P-PSDB; AAE00934. 61 lyvalGlyval. Example 1; Page 17-19; 31pp; Japanese.

The present sequence encodes a disintegrin and metalloprotease (ADAM) type metal protease designated MDTS1, isolated from human. MDTS proteins have cytostatic and antiarthritic activities. They can be used as a drug for cancers, arthritis and arthrosis deformans. 695 845 20 746 TAGCTGATGCCAAAATGGTGGAGTACCACGGACAGCCGCAGGTTGAGAGC 795 35 61 Sequence 5061 BP; 878 A; 1746 C; 1587 G; 850 T; 0 other; 15 LeuLeuSerLeuProGlnLeuCys.....LeuAs 24 pGlnGluValLeuSer.....GlyHisSerLeuGlnT 111 ::: 111 ::: 1796 TATGTGATCATGAACATGGTGGTGGCCTGTTTCATGACCCCAG 35 hrProThrGluGluGlyGlnGlyProGluGlyValTrpGlyProTrp...
